

Assignment:-2

Task 1:- Open your own laptop or desktop (or use an online PC hardware simulator if you don't have access to a real system) and identify the GPU model installed. Write down the GPU's brand, model number, and whether it is integrated or dedicated

Task 2:- Take a clear photo or screenshot of the cooling system (fan, heatsink, or liquid cooling setup) inside your PC or from a PC hardware simulator. Label the main cooling components and briefly describe their function.

Task 3:- Create a comparison table listing at least 3 differences between air cooling and liquid cooling systems for GPUs, including factors like cost, efficiency, and maintenance.

Feature	Air Cooling	Liquid Cooling
1. Cost	Lower cost; generally more affordable	Higher cost due to pumps, radiators, and additional components
2. Cooling Efficiency	Good for most users but less effective under heavy workloads	Excellent heat dissipation; ideal for gaming, rendering, and overclocking
3. Maintenance	Requires minimal maintenance; occasional dust cleaning	Requires more maintenance; periodic inspection of coolant, tubing, and pump

Task 4:- Imagine you are building a gaming PC for streaming IPL matches and playing graphics-heavy games. Choose between air cooling and liquid cooling for your GPU, and justify your choice in 3-4 sentences based on your research.

Answer:-

I choose **liquid cooling** for the GPU. Liquid cooling keeps the GPU cooler when playing heavy games and streaming IPL matches for a long time. It also makes less noise than air cooling. It is a good choice if you want better cooling and high performance. It helps the GPU work better during long gaming sessions. Although it costs more, it gives better cooling and performance.
