

Assignment:-3

Task 1:- Create a comparison table listing the main differences between DDR3, DDR4, and DDR5 RAM, including speed, voltage, and typical use cases

Type	Speed	Voltage	Common Use
DDR3	800-2133 MT/s	1.5V	Older PCs
DDR4	2133-5333 MT/s	1.2V	Most modern PCs
DDR5	4800+ MT/s	1.1V	Latest high-performance system

Task 2:- Open your laptop or desktop (with power disconnected), locate the RAM slots, and take a clear photo of the installed RAM module. Reinstall the RAM module and verify that your system boots up successfully. Refer to your device manual or a trusted YouTube guide if unsure about RAM removal and installation steps.

Task 3:- List three key differences between HDD, SSD, and NVMe storage types, and for each, name one app or use case (from apps you use daily) that would benefit most from that storage type.

Feature	HDD (Hard Disk Drive)	SSD (Solid State Drive)	NVMe SSD (Non-Volatile Memory Express)
1. Speed	Slowest; uses spinning disks	Much faster; uses flash memory	Fastest; connects directly through PCIe for very high speeds
2. Cost & Capacity	Cheapest per GB; available in very large capacities	More expensive than HDD	Most expensive per GB, especially high-performance models
3. Best Use	Long-term storage and backups	Everyday computing and faster boot times	High-performance tasks like gaming, video editing, and software development

Task 4:- Remove the storage drive (HDD or SSD) from your system, take a photo of the connector type (SATA, M.2, or NVMe), and reinstall the drive. Confirm that your device recognizes the storage after reassembly. Only perform this task if you have access to a device you are allowed to open. If not, find and share a YouTube video link showing the process for your laptop/PC model.
